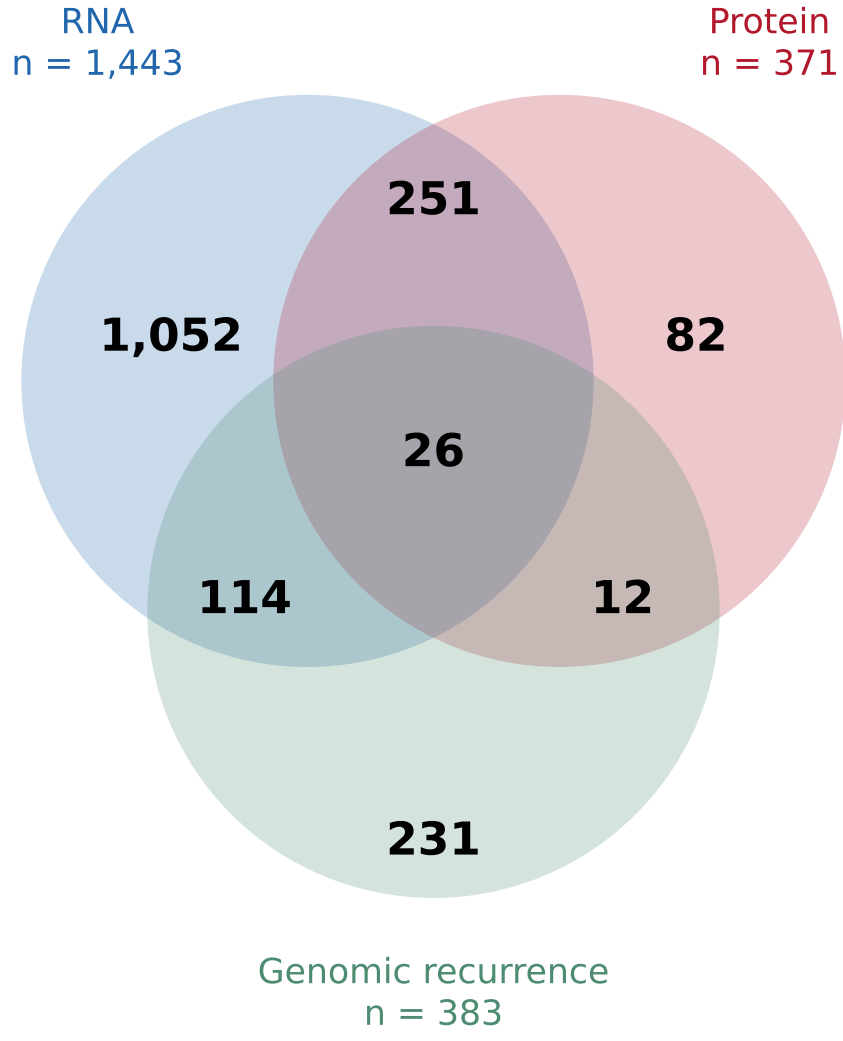
LUAD: overlap of thresholded positive evidence



RNA / protein: BH q ≤ 0.05, |mean log2 difference| ≥ 1, and ≥ 10 valid pairs.
Genomic: mutation in ≥ 5% of 108 tumors (descriptive recurrence, not a significance test).
Universe: 6,758 jointly measured mapped genes; outside all sets: 4,990.
Region counts are exact; circles are schematic, not area-proportional. Thresholds do not alter target ranks.
